Abstract

I claim Squito Net, is for keeping mosquitos and other insects out of a vehicle. The material is shaped in the form of a triangular bag. The netting would be elastic and double-nitted at the opening and the tip to prevent tears or breaks when appling to the window portion of the vehicles door. The elasticity of the netting will ensure a seal against the body of the door to keep out pest, at the same time allowing ventilation and some degree of visibility beyond the window.
